

Transitioning from 2D to 3D

Having problems deciding how to move from 2D to digital 3D? Concerned for the investment outlay of training & how this equates to the overall return on investment?

Darbury brings the experience & knowledge to companies wanting to make the transition from 2D to 3D but who are unsure of where to start, justifying the return on investment to senior management, what strategy to take from short to longer terms or what level of data is required to achieve the results in the field.

Taking a staged approach, building on the ROI & the experience level available is always the best solution. There are many vendors out there that want to sell licenses; Darbury can bring some non-biased sanity to the problem.

Darbury has been defining strategies, setting up systems, creating piping line classes, 3D modeling, engineer designing & using all aspects of digital systems for more than 34 years. Consulting on re-using models from vendors or other systems within your own models is a specialty the company brings to the equation.
